

one scene

Sentinel-2, Bolivia tile 209

two inferences, same windows

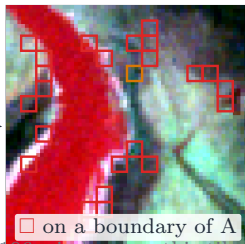

A: S2 head

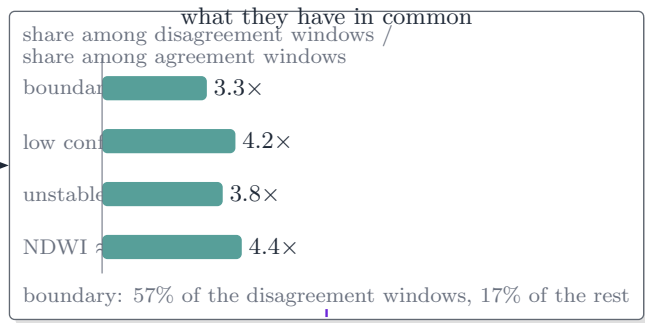

B: S1 head

where A and B differ, no labels

25 of 196 windows on this tile (13%),
10.9% of 71,373 over the testbed

the same measurement across time

two dates of one scene (GEOID-Flood, 55 events): pre-event S2 head against post-event S1 head.

3.4% of the windows differ, 10× boundary-enriched. Both sides confident on 41% of them: those are flooded by the label 52% of the time, against 27% of all differing windows.

a reading of the difference, not a proof of change (exp58)

are two differences the same set?

	offsets	backbones	sensors	fine-tune
offsets	1.00	0.29	0.20	0.28
backbones	0.29	1.00	0.27	0.28
sensors	0.20	0.27	1.00	0.31
fine-tune	0.28	0.28	0.31	1.00

phi between four pairs' disagreement sets:
different differences (median 0.28);
the same pair across head draws: 0.75

which side is right: with labels only
